

Many pipe casings require testing to failure from external pressure. This can involve extreme pressures and forces to collapse pipe from external pressure. These tests require extremely highly engineered equipment to withstand the forces placed upon them. DynaIndustrial has a range of vessel sizes and pressure ratings to achieve these tests; vessels up to 16' long, 16" bore and up to 30,000 PSI.

Not only do we have these extreme pressure vessels but they have been redesigned for quickly loading and unloading test samples.

Our monitoring system records the pressure curve of when the pipe collapses and fails.
