

DynaIndustrial is in the business of building OEM replacement parts.

With a large talented engineering group, it would be easy to assume that DynaIndustrial only supplies engineering services and internally engineered equipment. The fact of the matter is engineered products are only one area of our business.

Between the two DynaIndustrial facilities we have an expertly trained and experienced group of people dedicated to light and heavy fabrication. Our machining capability complements the fabrication with both CNC machining and multiple large boring mill capacity. In order to accommodate large orders and equipment repair we can lift 60 tons by overhead crane.

The pinch roll frame pictured below was supplied to a customer in the USA as an OEM replacement part. DynaIndustrial manufactured the pivot frame assembly and also supplied an engineered support frame to allow the unit to be easily extracted and inserted into the much larger assembly.
